

No universal coupling: the concentration-value-norm sign is arm-dependent

Per KV group: same concentration → opposite value-norm (pooled $r = -0.20$)

arm	n	Pearson r
baseline	90	+0.76
glgate	90	+0.57
sigmoid	90	-0.03
textinit	90	-0.79
rf	90	+0.51
POOLED	450	-0.20

one dot = one (layer, KV group); 90 per arm. r is descriptive, no p-values.

the SIGN flips by arm:
+0.76 baseline ... -0.79
